TITLE: On the nature of heterogeneous equilibrium in the
system germanium-aluminium-antimony

PERIODICAL: Akademiya nauk SSSR, Izvestiya, Otdeleniye,
tekhnicheskikh nauk, Metallurgiya i toplivo,
no.6, 1961, 149-151

INDEX: In earlier work of the authors and their team
(Izv. AN SSSR, OEN, Metallurgiya i toplivo, 1959, No.4)
it was established that the Ge-In-Sb in the ternary Ge-In-Sb
does not represent the real equilibrium between the solid and
liquid phases during crystallization and, consequently, does not
have all the properties of a binary system. Therefore, the
necessity arose to verify the results obtained with the Ge-In-Sb
system on other systems and the Ge-Al-Sb system was chosen for
this purpose. The Al-Sb compounds are thermally more stable
than In-Sb compounds and, therefore, it was to be anticipated that
the behaviour of aluminium and antimony during crystallization of
Ge-Al-Sb

On the nature of heterogeneous ... S/180/61/000/006/018/020

germanium will differ from the behaviour of In and Sb. For investigating this system, the method of drawing the primary crystals of the solid solution from the appropriate melts containing various quantities of the alloying components was chosen. Measures were taken for creating equilibrium conditions of crystallization and for obtaining single-crystal specimens. The specimens were drawn at a rate of 0.045 mm/min; the seed was rotated at a speed of 100 to 120 r.p.m. and the crucible remained stationary. The germanium used had a specific resistance of 10^{-4} ohm-cm and a diffusion length of 2.5 mm and an aluminium impurity content not exceeding 10^{-4} %; the antimony was grade CY-000 (40-000). On the drawn crystals of the solid solutions the Hall constant and the specific resistance were measured. Two sections of the system containing 98 and 97 at. % Ge with various ratios of Al and Sb contents were investigated. The compositions of the initial melts of germanium from which primary crystals were produced are those given in Table 1. On the basis of the measured values of the Hall constant, the specific resistance of the solid solution crystals, of the determination

Card 114

On the nature of heterogeneous ... S/180/61/000/006/018/020
E073/E535

of the type of conductivity and of the calculated values of the concentrations of the current carriers, graphs were plotted of the changes in the electric parameters of the solid solutions as a function of the concentrations of Al and Sb in the conjugate liquid phases. It can be seen that crystals drawn from melts with an equi-atomic ratio of Al and Sb contents (curves a₁ and b₁) have a clearly pronounced hole-type conductivity. A change in the ratio of these elements until the Sb atoms predominate above the Al atoms by a factor of 20 does not lead to a change in the type of conductivity. If the ratio equals 22 to 25, the crystals will have a mixed-type conductivity and only if the content of Sb is over 25 times that of the Al content will there be a change to electron conductivity. An increase in the content of Sb in the liquid phase as compared to the content of Al leads to a change in the ratio of these elements in the solid phase towards full compensation, thereby reducing the number of current carriers, and the specific resistance will begin to increase. After compensation, the type of conductivity changes into electron conductivity and the specific resistance will again

TITLE: Production and properties of strongly alloyed germanium

PERIODICAL: Referativnyy zhurnal, Fizika, no. 2, 1963, 71, abstract 2E473
("Tr. Soveshchaniya po udarn. ionizatsii i tunnel'n. efektu v poluprovodnikakh, 1960". Baku, AN AzerbSSR, 1962, 130 - 150)

TEXT: By the method of extracting the solid phase from a smelt with a large content of alloying admixture, single crystals of Ge were obtained with a concentration of Al up to $1.0 \cdot 10^{21} \text{ cm}^{-3}$, with a concentration of As up to $6.0 \cdot 10^{19} \text{ cm}^{-3}$, with a concentration of Sb up to $2.5 \cdot 10^{19} \text{ cm}^{-3}$ and with a concentration in In up to $2.0 \cdot 10^{19} \text{ cm}^{-3}$. It is established that there is an increase of solubility of In and Sb in Ge at a combined alloying, and this is explained on the basis of the electron-hole interaction in the solid phase. Applying the method of quantitative radiography and measuring the Hall effect made it possible to determine separately the concentration of In and Sb in the solid phase of Ge, while the data on the Hall mobility show an absence of neutral ion pairs $[\text{In}^- \text{Sb}^+]^0$. It was found that

Card 1/2

at room temperature the Hall mobility in Ge with Sb, in the range of Sb concentrations from $2 \cdot 10^{18}$ to $5 \cdot 10^{19}$, is about twice as high as the Hall mobility in Ge with As at equal concentrations of the admixtures.

germanium

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Otdeleniye tekhnicheskikh
nauk. Metallurgiya i toplivo. no.2, 1962, 131-134

TEXT: The initial materials used were electron type germanium
with a specific resistance of 50 ohm.cm and aluminium purified by
zone melting containing Fe $< 7 \times 10^{-4}\%$, Mg $2 \times 10^{-4}\%$,
Si $4 \times 10^{-4}\%$, Cu $5 \times 10^{-5}\%$ and Zn $< 1 \times 10^{-4}\%$. Alloys were
prepared by the extraction method and all the investigated samples
were single phase. The region of solid solution was investigated
at 675°C. It is shown that the concentration of Al in solid
solution varied from 9.97×10^{-3} at.% at a concentration of
Al of 0.1 at.%, to 1.544 at.% at 46.2 at.% Al. A solidus curve
is plotted on which is included results from earlier papers.
Good agreement is obtained at 850°C but the earlier results

TITLE: Study of the heterogeneous equilibrium in the system Ge-In-Sb

PERIODICAL: Zhurnal fizicheskoy khimii, v. 36, no. 9, 1962, 1914 - 1918

TEXT: The equilibrium between the solid and liquid phases was determined on three cross sections passing through the Ge-InSb cross section. The a - a cross section corresponded to a Ge content of 86.7 atom%, equilibrium temperature 860°C, the b - b cross section to a Ge content of 71 atom%, equilibrium temperature 812°C, and the c - c cross section to a Ge content of 41.2 atom%, equilibrium temperature 672°C. The concentration of admixtures (In, Sb) was determined in the Ge crystal pulled at 0.4 mm/min. n-type Ge was used, resistivity 30 ohm-cm, electron mobility 3600 cm/v-sec, diffusion length of minority carriers ≥ 2 mm. The crystals were examined radiographically, the number of carriers and the Hall constant were determined, and the macro- and microstructures were investigated. The Sb concentration was determined with the aid of Sb¹²⁴, the In concentration on the basis of the number of current carriers. Results:

TITLE: Investigation of hard radiations from plasma in a strong magnetic field

SOURCE: Zhurnal tekhnicheskoy fiziki, v. 33, no. 6, 1963, 710-714

TOPIC TAGS: Tokamak-2, high energy plasma, radiation from plasmas

ABSTRACT: Measurement of the hard radiation emitted is considered to be a desirable tool for the investigation of plasma behavior because it does not require the introduction of foreign objects into the discharge chamber. The x-rays and neutrons emitted by the "Tokamak-2" apparatus were investigated in two series of experiments beginning in 1959. Between the two series the apparatus was disassembled and reassembled, but no important changes were intentionally made. The results of the first series of experiments and a description of the experimental techniques and apparatus have been published elsewhere (V.V. Matveyev and A.D. Sokolov, ZhTF, 30, 10, 1145, 1960). The measurements of the x-ray yield at right angles to the electron trajectories made in the first series of experiments were repeated and the following differences were noted: the point of maximum yield shifted to somewhat lower values of the ratio of the electric field strength to the pressure (E/p); the x-ray yield increased severalfold; the mean energy of the

Card 1/32

I. 12914-63

ACCESSION NR: AP3001330

x-rays increased by 1.5-2 times; photons with energies up to 5 MeV were observed. The azimuthal distribution of the x-ray intensity was obtained for three different operating conditions, and the x-ray intensity was obtained as a function of E/p for both the electric field and the magnetic field in each of its two possible directions (four curves). The azimuthal distribution is not quite uniform and is not symmetric about the plane of symmetry of the equipment; the curves of yield versus E/p differ considerably from each other. These results are attributed to asymmetry of the field configuration. The x-ray yield was obtained as a function of E/p for four different plasmas consisting of hydrogen, deuterium, helium and argon. The mean energy of the x-rays decreases somewhat with increasing ion mass and is about 700 keV for argon. The shape of the yield curve for argon was considerably different from that for the other three plasmas, the maximum being multiple and shifted to higher values of E/p. Although the ion temperatures attained in the Tokomak-2 are not such as to lead one to expect neutron production in a deuterium plasma, a search was made for neutrons. None were found, and it is concluded that the neutron yield is less than $10 \sup 4$ neutrons/discharge when x-rays are absent and less than $10 \sup 5$ neutrons/discharge when x-rays are present. "In conclusion the authors convey their gratitude to G.G. Delgov-Savel'ev, V.S. Mukhovatov, V.S. Strelkov, V.Z. Sedin and other co-workers for assistance and for participation in discussions of the experiments. The work was performed at the initiative and under the guidance of N.A. Yavlinskiy (deceased)." TITLE: Polymerisation of Hexafluoro-1,3-butadiene
(Polimerizatsiya geksaftor-1,3-butadiyena)

PERIODICAL: Izvestiya Akademii nauk SSSR. Otdeleniye khimicheskikh nauk,
1959, Nr 6, pp 1111 - 1115 (USSR)

ABSTRACT: By way of introduction a short survey is given of what is already known about $\text{CF}_2=\text{CF}=\text{CF}=\text{CF}_2$, and about its capability of forming polymers (Refs 1-8). Since publications scarcely deal with these compounds, they were investigated by the authors, the conditions for their polymerisation and the properties of the polymers obtained were determined. Different initiators were used for polymerisation: $(\text{C}_2\text{H}_5\text{OCCO})_2^{(A)}$ at 50° , $[(\text{CH}_3)_3\text{CO}]_2^{(B)}$ at $90-130^\circ$ and 500-6000 atmospheres and $[(\text{CH}_3)_2\text{C}(\text{CN})\text{Al}]_2^{(C)}$ at 6000 atmospheres, triethylaluminum (D) and tributylboron (E). Suspension polymerisation was investigated in the presence of potassium persulphate (F). The three latter methods (D,E,F) failed. Tables

Card 1/2

Polymerisation of Hexafluoro-1,3-butadiene

SOV/62-59-6-26/36

1-5 give the investigation results obtained by using the different initiators. The initiator A proved to be most effective (yield 90% at 1.6 wt% A, pressure 6000 atmospheres, temperature 50°). A yield of only 33% was obtained with the initiator B, and if no initiator was used at all, after long heating and a pressure of 6000 atmospheres only a yield of 18%. In some figures the influence of pressure (Fig 1) and temperature (Fig 2) upon the polymerisation rate, and the influence of the initiator (Fig 3), the pressure (Fig 4), and the temperature (Fig 5) upon the thermomechanical properties of the polymers produced is shown. The thermomechanical properties were determined by the apparatus by Tsvetlin (Ref 9). There are 5 figures, 5 tables, and 9 references, 1 of which is Soviet.

8 torr, and it is stable up to 120°C. Complete decomposition with precipitation of lead occurs at 165°C. DEDVL is also a solid at room temperature (boiling point 74 - 74.5°C at 13 torr), and it is not very stable. Azoisobutyric acid - dinitrile, tributylboron, tributylaluminum, tetraethyl lead, tert-butylperoxide and -hydroperoxide, and benzoylperoxide were used as initiators in the polymerization of these compounds. The results are given in Table 1. With tert-butylperoxide at 120°C and 6000 torr, TEVL gave 27.8% yellowish unstable oil with a molecular weight of 1100. The other initiators and lower temperatures did not lead to polymerization. Under the action of the peroxides at 120 - 150°C decomposition occurred, liberating lead. Attempts at copolymerization were carried out with 1) styrol, 2) α -methylstyrol, and 3) methylmethacrylate at 6000 atm. Experiment 3) was not successful. Experiments 1) and 2) gave polymers with 4.5 - 6% Pb. Table 2 gives the results. These polymers had lower melting points and viscosities than the corresponding homopolymers (Fig. 1). DEDVL was even more stable. Decomposition occurred on the reaction with disulfur in the presence of H_2PtCl_6 or platinum on carbon (Table 3). Details of the reactions are given in Table 3.

of Macromolecules. IV.

PERIODICAL: Vysokomolekulyarnyye soyedineniya, 1960, Vol. 2, No. 9,
pp. 1360-1369

TEXT: The authors had previously studied (Refs. 1-3) the reaction of acetylene with dihydro tetraalkyl disiloxanes, and determined the structure of the polymers obtained on the strength of their infrared spectrum. In the present article, the authors report on the reaction of acetylene with dihydro siloxanes of varying molar ratios of the reagents. The reaction yields chain-like polymers with different terminal groups. The infrared spectra were examined for the absorption bands of the stretching vibrations of the -Si-H terminal group ($2100\text{-}2150\text{ cm}^{-1}$), of the C=C bond (vinyl group $1595\text{-}1600\text{ cm}^{-1}$, allyl group $1625\text{-}1635\text{ cm}^{-1}$), and the

group (infrared spectra Fig. 2). In both cases, the molecular weight increased, and the chain grew longer. Furthermore, dimethyl diphenyl dihydrodisiloxane was caused to react with acetylene. The polymerizate, a viscous mass, had the molecular weight 1670. Table 1 shows the results of the reaction of acetylene with tetramethyl- and dimethyl diethyl dihydrodisiloxane at a pressure of 15 atm. The infrared spectra (Fig. 3) of the oily products revealed both the presence of C-C bonds and of $=CH_2$ as terminal groups. Analyses and molecular weights of the fractions distilled in vacuum are given in Table 2. Only addition products and dimers were obtained on the reaction of phenyl acetylene and diphenyl acetylene with dihydrodisiloxanes (Table 3). With the exception of the reaction product from diphenyl acetylene and tetraethyl dihydrodisiloxane, whose structure is still unclear, the infrared spectra (Fig. 4) revealed $-Si-H$ bands. The infrared spectra were taken with a BNKC M-3 (VIKS M-3) spectrophotometer. The authors thank A. D. Petrov and I. V. Obreimov for interest displayed in the work. There are 4 figures, 3 tables, and 6 references: 4 Soviet, 1 US, and 1 German.

pressure. II. Polymerization of propargyl alcohol

PERIODICAL: Vysokomolekulyarnyye soyedineniya, v. 4, no. 4, 1962, 486-491

TEXT: Polymerization was studied under varying reaction conditions (pressure: 1 and 1500-6000 atm; at 50 - 200°C; reaction time 1 - 30 hr; with and without addition of various conventional initiators). The infrared and epr spectra of the reaction products were taken. Thermomechanical and elementary analyses of the polymers were made. Results: products varied from liquid, soluble (after reprecipitation, powdery) to solid, unsoluble (molecular weight 387-1500) depending on pressure and temperature. Below 80°C no polymerization took place, even in the presence of initiators at high pressures. The effect of initiators on polymerization was negligible. Polymerization took place on the basis of a rupture of the $C\equiv C$ bond of propargyl alcohol;

TOPIC TAGS: organosilicon compound, organosilicon polymer, cyclic compound

ABSTRACT: By directly reacting substituted acetylenes $XC \equiv CX'$ (where $X = H$ or Ph , $R = CH_3$ and $R' = C_2H_5$) with silanes of the general formula $HR'RSi-O-SiRR'H$ (where $R = CH_3$ and $R' = C_2H_5$) in the presence of $H_2PtCl_6 \cdot 6H_2O$ (0.1 M solution in the isopropyl alcohol) or $PtCl_2$ as catalyst, cyclic siloxanes with various substituents at the silicon atom were obtained.

1) $X = H$; $X' = Ph$; (2) $X = H$; $X' = Ph$; (3) $R = Ph$; $R' = CH_3$; (4) $R = CH_3$; $R' = C_2H_5$. The reaction takes place in a solvent mixture of isopropyl alcohol and acetic acid under pressure at 110-200° in the presence of $H_2PtCl_6 \cdot 6H_2O$ (0.1 M solution in the isopropyl alcohol) or $PtCl_2$ as catalyst.

the catalyst according to the equation

In addition to the cyclic compounds, addition products of linear structure are formed. The yield of the cyclic fraction is affected by the nature of the substituents in acetylene and of the radicals at the silicon in the dihydride disiloxanes. The structure of the cyclic compounds was identified by means of infrared absorption spectra, nuclear magnetic resonance spectra, ultimate analysis, and molecular weight determination. The polymers synthesized are capable of being used as catalysts to form linear polymers.

TITLE: The Structure of Rubbers and Their Adhesiveness

PERIODICAL: Uch. zap. Yaroslavsk. tekhnol. in-ta, 1959, Vol. 3, pp. 169-175

TEXT: An investigation was made into the effect on the adhesiveness of rubbers, of the difference in their structure, the length of molecular chains, the crystallization ability, the branching of molecules, and the increase in the number of phenyl groups. The adhesiveness was estimated from the adhesion force, which was determined by the load required to shift relative to one other the fabric strips saturated with rubber solutions and glued together. When glueing SKB rubber to butadiene-styrene rubber, containing different amounts of styrene (10, 30 and 50%), the adhesiveness decreases consecutively with increasing styrene residues. The adhesiveness passes through a maximum with a subsequent considerable decrease with the reduction of the molecule length of masticated natural rubber. The presence of the maximum is due to the existence of a reticular structure of unmasticated rubber, preventing the mutual diffusion

VOYENNA MEDICA Sec 5 Vol. 11/2 Pathology Feb. 58
568. THE INFLUENCE OF VITAMIN A DEFICIENCY ON THE COURSE OF
PURULENT INFLAMMATION AND REGENERATION OF SKIN WOUNDS
(Russian text) - Suchkova T. I. - ARKH. PATOL. 1957, 19/6 (15-23)
Illus. 6

In experiments on rats with vitamin A-deficiency a study was made of the prognosis of staphylococcal infection and wound healing. Experiments were made in 5 groups according to the duration of vitamin A deficiency (5-25 days) prior to staphylococcal infection. Even after A-avitaminosis of relatively short duration there were disturbances in protective reactions throughout the organism; the staphylococcal infection took a severe course and wounds showed reduced healing tendencies. Wound

568

healing lasted twice as long as in control animals; larger doses led to phlegmone formation and death. Pathognomonic of vitamin A deficiency were epithelial metaplasia in the trachea and bronchi, and in the bladder and renal calices. Ovarian follicle maturation and maturation of spermatozoa in the testes showed marked retardation; the adrenal cortex was poor in lipids; interstitial pneumonia sometimes occurred.

TITLE: Certain potentialities of the thermomechanical method

SOURCE: Plasticheskiye massy, no. 6, 1966, 53-55

TOPIC TAGS: thermomechanical property, ~~measuring apparatus~~, elastic deformation, cellulose plastic, plasticizer, LABORATORY INSTRUMENT

ABSTRACT: Apparatus for thermomechanical studies on films was developed and tested. The apparatus comprises an electromechanical arrangement for linearly changing temperature with time, and an optical (photographic) arrangement for recording deformation measured with a cathetometer. Work may be done in air or under nitrogen. Tests were run on cast cellulose triacetate films. The obtained thermomechanical curves showed the degree of anisotropy of the mechanical properties (deformation) in cellulose triacetate. The effect of different amounts of different stearate plasticizers was also evaluated. It was confirmed that the effectiveness of a plasticizer can be evaluated not only by the degree of glass

TITLE: Effect of abrasive conditions on the friction characteristics of molybdenum disulfide

SOURCE: Mashinovedeniye, no. 4, 1965, 108-114

TOPIC TAGS: molybdenum disulfide, friction coefficient, metal friction

ABSTRACT: The author study the effect of the sliding rate and loading on the coefficient of friction in molybdenum disulfide. A 20-30 μ layer of molybdenum disulfide was applied to the ends of annular bronze specimens. The material for the other member of the friction pair was 2Kh13 steel. The effect of surface finish on the friction properties of molybdenum disulfide was also studied. The effect of continuous stationary contact on the coefficient of friction in MoS₂ was studied by applying a layer of molybdenum sulfide to the internal surface of bronze sleeves

UDC: 621.894:

Card 1/2

L 32599-66

ACC NR: AP5017079

and mounting them on 2Kh13 steel shafts. Curves for the coefficient of friction in molybdenum disulfide as a function of sliding rate show a reduction in the coefficient of friction with an increase in sliding rate up to 1.5 m/sec. Beyond this point, friction increases with sliding rate. A curve for the coefficient of friction as a function of temperature close to the friction surface shows a reduction in friction with an increase of temperature below 100°. This is probably due to a reduction in the moisture content on the friction surface. There is an increase in friction with temperature beyond this point due to the partial oxidation of molybdenum disulfide on the friction surface. It was found that an increase in pressure reduces the coefficient of friction. 48 hours of stationary contact increases the coefficient of friction from 0.14-0.17 to 0.28-0.30. Under sliding friction conditions, this coefficient drops rapidly to the initial value. Experiments indicate that this phenomenon is due to the formation of molybdenum trioxide which absorbs moisture from the air during the stationary period. Tests indicate that a GOST 2789-59 class 8 finish is optimum for steel parts working against self-lubricating materials based on MoS₂. The coefficient of friction is reduced considerably by operation in a vacuum. Orig. art. has: 6 figures, 1 table. // 74

Suchocki E. Spring Drives

Naped sprzynowy. Przegląd Mechaniczny., No. 11, 1952,
pp. 439-443, 12 figs.

Spring drives are widely used in clockwork mechanisms and in numerous other precision instruments. Particular attention must, however, be given--in view of their importance, frequent use and numerous advantages--to spiral springs imparting a rotary movement. The author deals with the more important constructional varieties of spring drives containing spiral springs. The article also contains computations of power reserves in springs and of the driving moment, and explains the method of compiling graphs of tension and drive characteristics, as well as the contingency of the driving moment on the angle of bend in the spring. The author, finally specifies conditions for obtaining from the spring the maximum number of revolutions, and recommends methods for compensating the driving moment as the spring uncoils.

The importance of forces transmitted from busbars
to the terminals and forces exerted on windings by the
busbars is shown. Examples of damage produced by
these forces on s.c. are given. The oscillograms and
graphs of secondary s.c. current and s.c. primary
voltage are shown. The need in manufacture of a
routine test, with secondary open, of the insulation
between transformer windings is stressed with a view
to ensure dielectric strength under s.c. conditions.
